Summary

Backend engineer with production Go experience building high-throughput, event-driven systems in the payments and financial services space. Delivered a cross-service analytics pipeline processing 30M+ events/month, diagnosed and fixed a race condition in a concurrent 60-goroutine system, and shipped multi-currency payment features used by thousands of workers daily. Seeking to bring payments infrastructure expertise to Checkout.com's Payment Performance team.

Experience

Software Developer I — DailyPay, Belfast

Jul 2025 – Present *Go, Kafka, PostgreSQL, Terraform, gRPC, Docker, Datadog*

- Delivered end-to-end email-to-Amplitude analytics pipeline across 4 repositories (courier → dp-protos → data-router → Amplitude): ~1,900 lines added, gRPC integration, Protobuf schema design, Kafka topic management, and event transformation — full unit + integration test coverage
- Diagnosed and fixed production courier panic caused by race condition in Schema Registry client under 60-goroutine cold-start; implemented singleton pattern; verified with `go test -race`
- Integrated Iterable marketing platform via gRPC; built event testing suite validating schemas and idempotency across 30M+ events/month
- On-call engineer: monitored production systems, triaged panics, proposed and implemented remediations from incident start
- Integrated golangci-lint CI across 52 files (4–5 linters); decommissioned SMSO service (3,730 lines removed)
- Resolved critical production bugs under pressure; participated in load testing real-world APIs to identify breaking points

Data Engineer (Placement) — DailyPay, Belfast

Sep 2023 – Aug 2024 *Go, Python, PostgreSQL, Docker, AWS, Kafka*

- Designed and shipped ETL pipelines (v1–v3) for Gross Earnings and Available Balance, powering payroll calculations for tens of thousands of workers
- Implemented multi-currency API support for GrossEarnings, TipsDetailed, and TipsEarningsProviderAccountDetails endpoints — enabled company’s international expansion to Canada
- Built reusable internal libraries (daily-go) and automation tooling, improving pipeline efficiency by 18%
- Built V3 Earnings Job Status endpoint with full OpenAPI spec and integration tests; executed Schema Registry migrations across core and ledger repositories
- Created CI/CD pipelines with GitHub Actions; wrote Linux scripts for PostgreSQL cron job scheduling; Terraform migration to shared monolith module

Hackathon (DailyPay): Winner (£500) — Led 3-person team to build AR-based customer onboarding prototype; recognized by CEO

Education

B.Eng. Computer Systems Engineering — Brunel University, London *Sep 2021 – Jun 2025* - First Class Honours | Graham Hawke Award — Best Final Year Project in EEE - Dissertation: Knowledge Graph-Augmented LLMs for Patent Analysis

Skills

Category	Technologies
Languages	Go (production), Python, JavaScript, SQL, Bash
Infrastructure	Docker, Kubernetes, Terraform, AWS, GitHub Actions, Kafka, Prometheus, Datadog
Databases	PostgreSQL, Neo4j, Snowflake
Practices	Event-driven architecture, microservices, gRPC/Protobuf, CI/CD, on-call, OAPI spec
Other	LLM fine-tuning, Knowledge Graphs, LeetCode 150+

Projects

Bare Metal Kubernetes Cluster Built 4-node K8s cluster (3× Raspberry Pi + custom CPU) with Helm, k9s, nginx load balancing, 1.2TB NAS. Automated deployments with reusable manifests; tunneling via ngrok.

Patent Knowledge Graph (Dissertation) NLP + semantic search pipeline to map chemical patent relationships using Python, Scrapy, Neo4j, vector embeddings, and LLMs. Awarded Best Final Year Project (EEE faculty).
